SELECTING THE BEST SUB-CLOVER VARIETY FOR YOUR SITUATION

The chart below can help you select varieties that have been bred for improvements in yield, pest and disease resistance, hardseededness and seed yield for regeneration. You should select the correct sub-species (subterranean, yanninicum, brachycalycinum or mix) for different soil types in paddock, then select the most appropriate variety for your rainfall. It is often advisable to mix 2-3 varieties to cover the fact that seasons and rainfall can vary by year. **For example:**

A mix of **Narrikup** and **Rosabrook** could be used in 600-650 mm rainfall to cover higher or lower rainfall years, or

A mix of **Rouse** and **Rosabrook** could be used where parts of a paddock can become waterlogged in some years but rainfall is reliable.
