

DIPLOID ANNUAL
RYEGRASS

RGT ROZEN

Improved late maturity diploid
annual ryegrass

- > Fine, densely tillered, better suited to hay than tetraploids
- > More feed when it is needed most
- > Fast establishing, including over-sowing sub-tropical pastures
- > Improved yield potential and palatability
- > High winter activity
- > Excellent seedling vigour
- > Excellent disease tolerance

Suited to all livestock
type, silage and hay

DIPLOID ANNUAL RYEGRASS

RGT ROZEN

RGT Rozen is an improved late maturity diploid annual ryegrass

GENERAL FIT

RGT Rozen is a new highly winter active annual ryegrass, developed in Europe to replace the highly successful Sultan. It has excellent seedling vigour making it suitable for sowing into either clean paddocks or over-sowing into sub-tropical pastures including setaria and kikuyu.

RGT Rozen has similar forage yields and maturity to Sultan, but much improved resistance to a range of diseases including crown rust, brown rust and powdery mildew.

As a diploid RGT Rozen is a densely tillered variety which will better withstand periods of winter dry conditions as its narrower leaf blades lose less moisture through evapotranspiration. This also enables it to cure faster for making high quality hay.

RGT Rozen can be sown as the sole ryegrass at lower sowing rates than tetraploids, but can also be mixed with tetraploids in a 40/60 mix to develop a strong sward with the early production from the tetraploid, but with later density and production from the diploid.

SOWING RATE

Oversowing kikuyu	30-40kg/ha
>850mm irrigation	30-40kg/ha
700-850mm rainfall	20-25kg/ha
500-700mm rainfall	20kg/ha
Oversowing perennial pastures	15kg/ha

The technical data in this document comes from test carried out by RAGT. The results obtained may vary according to agronomic and climatic conditions, as well as cultivation techniques. The technical data provided is for information purposes only and does not bind RAGT contractually.
